

■ Solutions & Standards

Our software solutions are intended for logistics service providers, freight forwarders, transport companies and shipping agencies. They are used in the international environment and satisfy not only global IT standards but also the most stringent industry standards, such as those of the automotive industry.

■ High Tech

The use of state-of-the-art technologies and a very flexible software architecture enables us to combine the individual modules in such a way that they suit the customer's requirements.

■ Continuity

Our solutions have proved their worth through many years of use by well-known customers and are subject to a process of constant analysis and expansion.

■ Farsightedness

In conjunction with customers and partners we continuously ascertain the latest requirements of the industry, already thinking today about the possible challenges of tomorrow. This provides our customers with a decisive advantage over their competitors.

■ Flexibility

More than just good software is needed to be able to meet the various requirements of the customers. The question of how the software can be operated at what cost is as important as it is decisive.

Our software architecture allows us to make every conceivable mode of operation available to the customer, starting with installation of the software on site, through to computer centre operation in which the customer is provided with both the hardware and also additional software such as spreadsheeting, text processing and an e-mail client.

Freedom from viruses, data security and high availability are, of course, included.
